

InfoTech and Wellness Checkpoint®

Wellness Checkpoint is the Global Leader for Health and Business Risk Management

InfoTech Inc. is a recognized leader in health and productivity risk management. A Canadian company with a global reach, InfoTech developed the first online, interactive health risk assessment (HRA), Wellness Checkpoint®. Since its initial release in 1990, Wellness Checkpoint has evolved into a multilingual, global web-based service used by many Global Fortune 500 companies. Delivered as an online, multilingual (26 languages and counting), global hosted Software as a Service, Wellness Checkpoint integrates into the business fabric of health, benefits, HR and risk management.

Wellness Checkpoint guides employees through a dynamically tailored, confidential assessment which considers their health in the context of their job and work organization as well as their life outside of work. On completion, an intuitive, interactive Dashboard tells them “here’s where you’re at” and “here’s where you’re headed”, encouraging them to set goals and take action. It allows them to update their profile as they reach their goals and track their progress over time. Personalized personal profile reports summarize and interpret the results of the assessment for each employee, supplemented by employee-specific action reports (“here’s what you should do”) that highlight areas for change and resources available to support change.

At a business level, Wellness Checkpoint **“connects the dots”** between health, lifestyle and productivity and supports informed decisions for enhanced performance, delivering the value which is key to engagement of both employees and business leaders as part of an overall process of personal and business improvement.

Wellness Checkpoint helps **performance-driven** companies identify:

- at-risk groups and analyze key measures of health and productivity upstream of claims and disease; and
- risk exposure and evaluate opportunities for action and track impact over time, supporting informed business decisions for health and productivity risk management at the program, site, regional and corporate levels;

and integrates seamlessly into corporate wellness programs including local programs, online resources, lifestyle management, screening, disease management and employee assistance provided through internal and third party resources at local, regional or corporate levels.

Wellness Checkpoint is configured and tailored specifically for each client. Each implementation is supported by an experienced Client Services team who work closely with the client to implement, maintain and support their application and its use within their organization.

Wellness Checkpoint is used by leading multinational corporations, as well as providers of wellness, occupational health, insurance, employee assistance and work/life services, in over 135 countries. Wellness Checkpoint easily adjusts for cultural preferences and clinical guidelines in the various countries where you do business. It meets international and national standards and complies with all applicable privacy, security and accessibility requirements and regulations.
